

AMENDMENTS TO THE SPECIFICATION:

Please amend the paragraph at page 11, beginning at line 16:

Having regard to Figures 1 and 4, in a first step 400, the Web Server 100 receives a request from the second computer 114 for access to a given Web Page stored on the Web Server 100. As will be well known, this request will typically be initiated through the user of the second computer 114 clicking on a hyperlink, the Uniform Resource Locator (URL) of which points to the given Web Page. As is also well known a URL typically includes a file name. Of course a "domain name" part of the URL will also be present and must be resolved to identify the computer to which a request is directed. As those in the art also well appreciate, a file name may take the form of a path name. As will be further well known, the Web Server 100 will have a process monitoring TCP port 80 for receiving incoming connections from clients. Once a TCP connection has been established, then the HTTP request for the Web Page can be made as above.
